Claim 1; Fig 1; 11pp; Japanese.

This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression ${\sf c}$

```
ó
chitinase gene in which the mRNA is extracted from a fully hardened autum wheat PII/3438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant pathogenic microbes.
                                                                                                                                                                                                       61 IAAANTFPGFGTTGSADDIKRDLAAFFGQTSHETTGGTRGAADQFQWGYCFKEEISKATS 120

The present sequence is winter rye (Secale cereal L. cv. Muskateer)
(ETT46 preprotein. The mature protein, which is also claimed, is a chitinase-like protein that has chitinase (antifungal) and antifreeze activities. CHT46 cDNA (see AAXA4890) was obtained by isolating manh from rye plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed in chitinases with antifreeze activity would be expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thaliana. The chitinase-like antifreeze proteins can be used: to increase field survival of plants, animals and microorganisms; to increase field survival of plants, animals and microorganisms exposed to sub-zero temperatures; to inhibit ice recrystallisation in biological capterials or foods; for cryopreservation and hypothermic protection of cells, embryos, tissues etc. (particularly human platelets); and to cills, embryos, tissues etc. (particularly human platelets); and to diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, froze foods and any cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved biological material. The signal peptide can be used cryopreserved by the percentage of the pathogens cryopreserved by the percentage of

The present sequence is winter rye (Secale cereal L. cv. Muskateer)
CHT46 mature protein. It lacks the 22-amino acid signal peptide
of the preprotein (see AAM98081), which is also claimed. Mature
CHT46 is a chitinase-like protein that has chitinase (antifungal)
and antifreeze activities. CHT46 preprotein cDNA (see AAX24890) was
condained by isolating mRNA from rye plants grown at low temperatures
in the absence of pathogens or other stresses, i.e. under conditions
in the absence of pathogens or other stresses, i.e. under conditions
when only chitinases with antifreeze activity would be expressed in
bacterial and yeast (Pichia) systems and in Arabidopsis thaliana.
CHT46 and CHT9 (see AAW98079-80) have been cloned and expressed in
bacterial and yeast (Pichia) systems and in Arabidopsis thaliana.
CHT46 and CHT9 (see AAW98079-80) have been cloned and expressed in
bacterial and yeast (Pichia) systems and in Arabidopsis thaliana.
CHT46 and CHT9 (see AAW98079-80) have been cloned and expressed in
bacterial and yeast (Pichia) systems and microcorganisms to increase field
survival of plants, animals and microcorganisms exposed to sub-zero
chemperatures; to inhibit ice recrystallisation and hypothermic protection
of cells, embryos, tissues etc. (particularly human platelets); and
progression of diseases or spoilage caused by low temperature
chypreserved biological material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GQTSHETTGGTRGAADQFQWGYCFKEEISKATSPPYYGRGFIQLTGRSNYDLAGRAIGKD 147

The present sequence represents a maize chitinase polypeptide. The prescrition describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18894, AAB18895, AAB188902-05), and glucosyl hydrolase family 18 chitinases (AAB18895, AAB189907-98 and AAB18900-01). The level of chitinase in plants can be modulated to enhance disease resistance in are also useful as molecular markers for genotype in a plant, and for sequence shuffling.
                                                                                                                                                                                                                                                                                                 New maize chitinase genes encoding seven chitinases of glucosyl hydrolase family 19 are useful for enhancing disease resistance in crop plants by modulating its expression in plants
             Chitinase; glucosyl hydrolase family 19; glucosyl hydrolase famiy 18; pathogen control; disease resistance; molecular marker.

pcht28 (AAQ93034) and pcht1 (AAQ93035), were derived from the leaves of drought-stressed L. chlease plants. The encoded chitlanses (AAR76712, AAR76713, respectively) may protect plants from pathogen attack during water stress. Recombinant chitinase was expressed in E. coli.
                                                                                                                                                                                                                                                                                                                                                    New endo:chitinase gene and protein - isolated from wild tomato
Lycopersicon chilense plants, having activity against plant pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 123 YYGRGPIQLTGRSNYDLAGRAL--GKDLVSNPDLVSTDAVVSFRTAMWFWMTAQGNKPSC 180

                                                                                                                                                                                                                                                                                                         This sequence was deduced from a P.hybrida cDNA sequence having 80 per cent homology with tobacco clone PROB30 which encodes extracellular chitinase PR-Protein R. The gene can be inserted into an appropriate plasmid for production of transgenic plants having resistance to fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extracellular chitinase; antifungal; transgenic plant; synergism; beta-1,3-glucanase gene.
                                                                                                                                                                                                                                          Plants with improved resistance to pathogenic fungi - othitinase and/or beta-1,3-glucanase genes modified for over-expression targetted to apoplasts
                                                                                                                                                                   Van Bol

                                                                                                                                                                                                                                                                                                                                            2 Osmotic stress and ABA-responsive endochitinase cDNA clones, pcht28 (AAQ93034) and pcht1 (AAQ93035), were derived from the leaves of drought-stressed L. chilense plants. The encoded chitinases (AAR76712, AAR76713, respectively) may protect plants from pathogen attack during water stress. Recombinant chitinase was expressed in E. coli.

                                                                                                                                                                                                                                                                                                This sequence represents an extracellular chitinase which is used to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-glucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase gene exhibit a synergistic antifungal effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PGFGTTGSADDIKRDLAAFFGQTSHETTGGTRGAADQFQWGYCFKEEISKATSPPYYGRG 127

```
The present sequence represents an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1,3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungi. The recombinant polynucleotides and the process are useful for producing fungal resistant plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New transgenic plants expressing chitinase and glucanase have improved resistance against pathogenic fungi, particularly against Alternaria alternata or Fusarium oxysporum f. sp. lycopersici

This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat PII73438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ----YY 124

Chitinase is an enzyme which breaks down chitin, the major protein in insect exoskeletons. The coding sequence may be used in the construction of transgenic organisms, especially plants, to produce pathogen resistan organisms. The genome of such transgenic organisms preferably contains more than one gene with pathogen inhibiting activity, each gene under the control of active promoters. The two gene products then show a synergistic increase in pathogen induced activity so that the transgenic organisms have a greater degree of resistance or resistance against a wider spectrum of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     118 -----ATSPPYYGRGPIQLTGRSNYDLAGRAIGKDLVSNPDLVSTDAVVSFRTAMWFWM 171

                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fungi. Plants have this enzyme to protect themselves from being infected with pathogenic fungi, and the chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease resistance on plants as

```

```
The sequence given is encoded by the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this protein in mature plants is characteristic. There is a low level of expression in leaves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in monor or dicoryledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ---AISPPYY 124

Patent No. 555647
GENERAL INFORMATION:
APPLICANT: Zohreh Tabaeizadeh
TITLE OF INVENTION: A novel endochitinase gene
TITLE OF INVENTION: induced by osmotic stress and abscisic acid isolated
TITLE OF INVENTION: from the wild tomato Lycopersicon chilense Dun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     63 AANTFPGFGTTGSADDIKRDLAAFFGQTSHETTGGTRGAADQFQWGYCFKEEISKATSPP 122

chitimase (EC 3.2.1.14) - rice
C;Species: Oryza sativa (rice)
C;Accession: S39979
R;Nishizawa, Y.; Kishimoto, N.; Saito, A.; Hibi, T.
MOI. Genet. 241, 1-10, 1993
A;Title: Sequence variation, differential expression and chromosomal location of rice cha;Reference number: S39979; MUID:94049667
A;Reference rumber: S39979; MUID:94049667
A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-339 FMBL:X56787
C;Superfamily: lectin-related plant chitinase; hevein chitin-binding domain homology; pl
C;Superfamily: lectin-related plant chitinase; polysaccharide degradation
F;33-74/Domain: hevein chitinase homology <PCH>
F;91-329/Domain: plant chitinase homology <PCH>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               당
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŝ

-!- FUNCTION: THIS ACIDIC CHITINASE FUNCTIONS AS A DEFENSE AGAINST CHITIN CONTAINING FUNCAL PATHOGENS.
-!- CATALYTIC ACTIVITY: HYDROLYSIS OF THE 1,4-BETA-LINKAGES OF N-ACETYL-D-GLUCOSAMINE POLYMERS OF CHITIN.
-!- SUBCELLULAR LOCATION: EXTRACELLULAR.
-!- INDUCTION: BY FUNGAL INTECTION.
-!- SIMILARITY: BELONGS TO CHITINASE CLASS IB WHICH IS SIMILAR TO

Bol J.E., van Roekel J., Meulenhof J., Conelissen B.J.C.;
"Analysis of acidic and basic chitinases from tobacco and petunia and
their constitutive expression in transgenic tobacco.";
Mol. Plant Microbe Interact. 3:252-258(1990).
-!- FUNCTION: THIS ACIDIC CHITINASE FUNCTIONS AS A DEFENSE AGAINST
-!- CATALYIC ACITATIVITY: HYDROLYSIS OF THE 1,4-BETA-LINKAGES OF
-!- STRALT-D-GLIGOSAMINE POLYMERS OF CHITIN.
-!- STRALT-D-GLIGOSAMINE POLYMERS OF CHITIN.
-!- SIMILARITY: BELONGS TO CHITINASE CLASS IB WHICH IS SIMILAR TO
CLASS IA IN THE CATALYIC PART BUT LACK A N-TERMINAL CHITIN-
BINDING LECTIN DOMAIN (BELONGS TO FAMILY 19 OF GLYCOSYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  127

                                 -- CAMALATIC ACTIVITY: HYDROLYSIS OF THE 1,4-BETA-LINKAGES OF N-ACETYL-D-GIDCOSAMINE POLYMERS OF CHITIN.
-- SUBCELLULAR LOCATION: VACUOLAR AND PROTOPLASTS.
-- ITSSUE SPECIFICITY: HIGH CONSTITUTIVE LEVEL IN ROOTS WITH LOWER LEVELS IN LEAVES AND FLOWERSON.
-- INDUCTION: FRHYLENE INDUCES HIGH LEVELS OF SYSTEMIC EXPRESSION OF BASIC CHITINASE WITH EXPRESSION INCREASING WITH PLANT AGE.
-- SIMILARIY: BELONGS TO CHITINASE CLASS IN WHICH IS SIMILAR TO CLASS IB IN THE CAPALITY. PART BUT WHICH INCLUDE A N-TERMINAL CHARIN-BINDING LECTIN DOMAIN (BELONGS TO FAMILY 19 OF GLYCOSYL HYDROLASES).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chitin degradation; Chitin-binding; Signal
Res. 7:217-221(2000).
FUNCTION: THIS PROTEIN FUNCTIONS AS A DEFENSE AGAINST CHITIN
CONTAINING FUNGAL PATHOGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    REMOVED IN MATURE FORM (PROBABLE) CHITIN-BINDING (BY SIMILARITY).
